

Select Fix 0.33 is out !

31-03-2009

It's been a while since last release ;-)

Some bugs are fixed with this release. And one new option is available !

Note (please read it) : If you have floating items that need to be over select elements, and if they have floating children too, you have to use `SelectFix.parseFloatingElementsFixed(true)` there's no other way to fix those childrens ! If you encounter problems like disappearing items while using `SelectFix` you might need this option. Keep that in mind and watch the examples !

Bugs fixed :

- "thin, medium, thick bug" which caused some weird problems when adding sizes (thank you Jonathan for reporting!)
- `SelectFix.parseFloatingElementsFixed(true)` was buggy as hell ! It caused the browser to crash (infinite loop). This is now fixed (thank you Kamal Kaddouri for your help to discover this bug!).

New option :

- `SelectFix.parseOnlyIfAvailableSelectElements(bool)` : Indicates whether to parse the DOM tree only if there are `Select` elements (default is true). Why would you need this option ? If you have other controls that reacts like `SELECT` elements. For example : windows media player control.

Please take a look at the examples in the archive, it's very easy to implement this.

You can download `Select Fix 0.33` here !
